

An illustration of two people sitting in large, brown armchairs against a dark background. The person on the left has red hair and is wearing a yellow sweater and blue jeans, with their hands near their face. The person on the right has dark hair and is wearing a light blue sweater and blue jeans. A brown backpack sits on the floor to the left of the first chair. The text 'Virtual Guided Behavioral Therapy' is centered over the image in a large, white, sans-serif font.

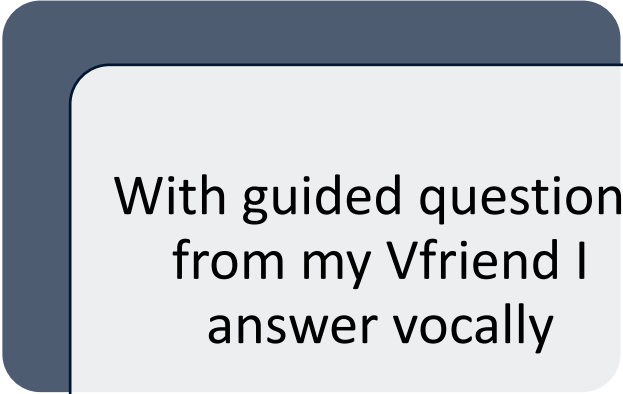

Virtual Guided Behavioral Therapy

Your 24/7 companion

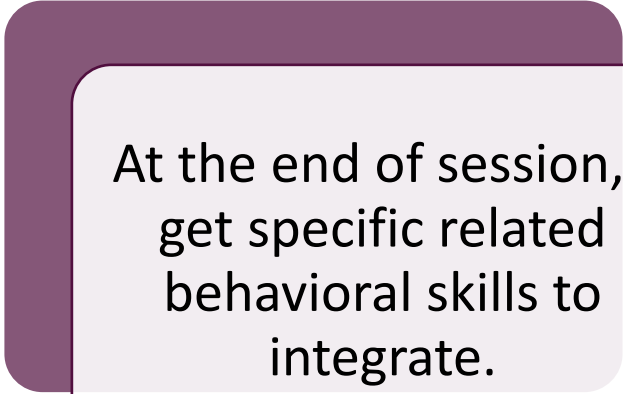

How it works:

I start by selecting categories of concerns: Social anxiety, specific phobias...

With guided questions from my Vfriend I answer vocally

At the end of session, I get specific related behavioral skills to integrate.

Technical Solution:

Vfriend: using AI for custom Personality

The session consists of:

- Assessment: from your voice input and guided by Vfriend questions.
- Diagnosis: from speech to text, then run sentimental analysis + emotion detection + custom tools bounded to areas of interest (category of concern).
- Suggestion: deliver custom response in accordance to discussed issue.

Example Scenario:

- Your input: Every time I go out, or have plans to go out, I start to feel reluctant and want to stay at home. If I do go out, I want to go home as soon as soon as possible and want to hide myself when I am in public.
- Desired response:
 - suggest specific deep breathing exercises when outside.
 - Recommend reconnecting with senses to disconnect from perceived attention.
 - Arrive early at meeting point to avoid being overwhelmed.
 - Avoid alcohol, it may make you more relaxed on the spot but the next day it will worsen your condition.
 - Replenish on Vitamins specifically, A, K, D, mg
